A 3D Medium Operatorial Framework for Environmental Tidal Response: Negative Metric-Gate Audit and Operatorial Status Update

Pietro Risi
Independent researcher

Version 3.0.0 status update

Abstract

This version 3.0.0 status update summarizes the post-V1018 correction of the public GTE 3D Medium record. The present version corrects the public metadata, adds a minimal bibliography, and clarifies that the 3D-to-2D relation is an architectural composition of operatorial modules rather than a new bridge result. The scientific content is unchanged. The defensible 3D core remains an operatorial environmental tidal-response pipeline. The negative update is the V993–V1001 audit: with the current assets, no non-circular route from the operatorial medium to a physical metric, universal matter/light coupling, Newtonian limit, or local PPN viability has been derived. The 2D residual is retained only as an operatorial/EFT-inspired environmental memory-screening module. No new numerical execution, fit, detection, gravity derivation, dark-matter claim, or dark-energy claim is made.

1 Relationship to the existing Zenodo version chain

This document is intended as a corrected version 3.0.0 update for the existing GTE 3D Medium Zenodo version chain, not as a new standalone record. The current public lineage should be preserved through Zenodo's new-version workflow rather than by creating a separate record with duplicated content.

The prior public operatorial core is the V669B/V845 lineage. The version 3.0.0 update should be described as a status and negative-gate update: it adds the V993–V1001 no-go map and corrects the V1018 metadata and bridge wording, while keeping the physical claim boundary closed.

2 Defensible 3D operatorial core

The surviving 3D core is the operatorial chain

$$\rho \to \Phi \to E_{ij}^{\mathrm{proxy}}/T_{ij}^{\mathrm{smooth}} \to J_{\text{tidal grid shell}} \to U.$$

In the earlier public record, the auxiliary response was described by a screened operator

$$(-\nabla^2 + m_{\mathrm{env}}^2)U = J_{\mathrm{env}},$$

with the three-dimensional Green kernel

$$G_\mu(r) = \frac{e^{-\mu r}}{4\pi r}.$$

Unless explicitly specified, U denotes an auxiliary operatorial response variable, not a physical gravitational potential. The status of this object remains narrow: it is a reproducible operator-level environmental tidal-response construction. It is not a true relativistic Weyl tensor calculation, not an SMS projected-Weyl calculation, not a physical gravitational field equation, and not a metric derivation.

3 Negative metric-gate audit: V993–V1001

The scientific content added after the earlier public record is primarily negative and methodological. V993–V1001 tested several routes for promoting the operatorial medium toward physical gravity. The audited routes included variational/elastic response, intrinsic strain variables, intrinsic connection/curvature, pregeometric-to-metric maps, and bulk/embedding-action routes. The active conclusion is:

> The framework has not failed as an operatorial environmental-response framework. It has failed, with current assets, as a derivation of physical gravity.

Gate	Status	Reason
Physical metric	CLOSED	no non-circular derivation of $g_{\mu\nu}$
Matter/light coupling	CLOSED	no universal coupling to a derived metric
Newtonian limit	CLOSED	no target-free derivation of Poisson or $1/r$ behavior
Local PPN viability	CLOSED	no γ_{PPN} pass
True Weyl/SMS	CLOSED	no true relativistic Weyl or 5D projected-Weyl calculation
Observational validation	CLOSED	no fit or detection

4 2D/EFT residual: operatorial module only

The surviving 2D-inspired residual is only the operatorial/EFT memory-screening schematic

$$J_{\mathrm{env}} := I_L \to U \to K_{\mathrm{env}} \to Q_D.$$

Here again, U denotes an auxiliary response variable unless a separate physical identification is supplied. It is an instance of the same screened-response template, not automatically the same physical field as any variable in the 3D chain. This is not a recovered 2D membrane theory of gravity. The source I_L is a fixed operatorial environmental intensity. The response U, kernel K_{env}, and diagnostic Q_D remain auxiliary/operatorial unless a separate physical metric map, conservation structure, and matter/light coupling are derived.

5 Architectural composition, not bridge result

The V1018 wording treated the 3D-to-2D relationship too prominently. The corrected wording is:

The 3D source/intensity output may be used as an input convention for the 2D/EFT-inspired memory-screening module. This is architectural composition between operatorial modules, not a theorem, not a non-trivial compatibility result, and not a physical bridge to gravity.

Thus the safe composition is

$$\text{3D source/intensity} \to I_L/J_{\text{env}} \to U/K_{\text{env}} \to Q_D,$$

but no result attaches to this composition beyond bookkeeping and claim separation.

6 Claim boundary

This release claims: a preserved 3D operatorial environmental tidal-response core; a negative V993–V1001 map of failed or blocked routes toward physical gravity; a corrected author/bibliography/wording update for a version 3.0.0 public upload; an operatorial/EFT residual module only at the level of I_L, U, K_{env}, and Q_D; and architectural composition between the 3D and 2D/EFT modules, not a scientific bridge result.

This release does not claim: derivation of gravity; derivation of dark matter or dark energy; local PPN viability; a Newtonian or Poisson derivation; a true Weyl/SMS calculation; an observational detection; or a physical replacement for general relativity.
